

1 federal laws and regulations; and meet other obligations such as the Hanford Federal Facility Agreement
2 and Consent Order (also referred to as the Tri-Party Agreement, or TPA) (Ecology et al. 1989).

3
4 To address anticipated needs for waste management capabilities, DOE proposes to do the following:

- 5
- 6 • continue to operate existing treatment, storage, and disposal facilities for LLW and MLLW, and
7 treatment and storage facilities for TRU waste
- 8 • construct additional disposal capacity for LLW
- 9 • develop capabilities to treat MLLW
- 10 • construct additional disposal capacity for MLLW
- 11 • construct disposal capacity for ILAW and WTP melters
- 12 • close onsite disposal facilities and provide for post-closure stewardship of disposal sites
- 13 • develop additional capabilities to certify TRU waste for disposal at WIPP.
- 14

15 Alternatives proposed to accomplish the purpose and need are described in Section 3. The No Action
16 Alternative is also evaluated as required by NEPA. For purposes of analysis in this HSW EIS, the No
17 Action Alternative is defined as continuing ongoing activities, or as implementing previous NEPA
18 decisions where those activities have not commenced.

19

20 **1.3 Overview of Hanford Site Operations and DOE Waste**

21 **Management Activities**

22
23 The Hanford Site occupies approximately 1517 km² (586 mi²), principally in Benton and Franklin
24 counties of south-central Washington state (Figure 1.1). The Columbia River flows through the northern
25 and eastern parts of the site, which extends about 46 km (25 mi) north from Richland, Washington.

26
27 DOE and its predecessors, the Manhattan Project, the U.S. Atomic Energy Commission (AEC), and
28 the U.S. Energy Research and Development Administration (ERDA), have operated the Hanford Site
29 since the 1940s. From the beginning through the 1980s, the primary mission at Hanford was to produce
30 nuclear materials in support of United States defense, research, and biomedical programs. Operations
31 associated with those programs used facilities for fabrication of nuclear reactor fuel, reactors for nuclear
32 materials production, chemical separation plants, nuclear material processing facilities, research
33 laboratories, and waste management facilities. Plutonium production at Hanford has ceased, and DOE
34 activities at the site currently include research, environmental restoration, and waste management.
35 Additional historical information regarding the Hanford Site is available on the Internet at
36 <http://www.hanford.gov>.

37
38 In addition to the DOE activities at Hanford, there are several facilities operated by other agencies at
39 the site. The Laser Interferometer Gravitational Wave Observatory (LIGO) is an advanced scientific
40 observatory for measuring gravity waves at extremely low levels. The project involves the California
41 Institute of Technology, the Massachusetts Institute of Technology, and the National Science Foundation.
42 The Hanford Site was selected for the LIGO because of its available space and seismic stability. A

Figure 1.1. Hanford Site Location Map

commercial nuclear power plant, the Columbia Generating Station, also operates within the Hanford Site. That facility is located on property leased to Energy Northwest, a consortium of regional public utilities.

The largest non-DOE federal agency at Hanford is the U.S. Fish and Wildlife Service, which co-manages with DOE the 195,000-acre Hanford Reach National Monument, which was established by presidential proclamation on June 9, 2000. The monument includes the Fitzner/Eberhardt Arid Lands Ecology Reserve (ALE), Saddle Mountain Wildlife Refuge, Wahluke Slope, White Bluffs, the sand dune area northwest of the Energy Northwest Site, historic structures (including homesteads from small towns established along the riverbanks in the early 20th century), and land 0.4 km (¼ mi) inland on the south and west shores of the 82-km (51-mi) long Hanford Reach, the last free-flowing, non-tidal stretch of the Columbia River. Also included were the McGee Ranch and Riverlands area and the federally owned islands within that portion of the Columbia River.

US Ecology, Inc. operates a commercial low-level radioactive waste disposal facility on 40.5 hectares (100 acres) of the Hanford Site near the 200 East Area leased by Washington State from DOE. The facility is licensed by the U.S. Nuclear Regulatory Commission (NRC) and the State of Washington, not DOE. The US Ecology facility is one of three commercial LLW disposal facilities in the United States. It currently accepts waste from two state compacts established to manage radioactive waste from nuclear power plants and other commercial facilities: the Northwest Compact (Washington, Idaho, Oregon, Montana, Wyoming, Utah, Alaska, and Hawaii) and the Rocky Mountain Compact (Colorado, Nevada, and New Mexico). Waste is received from hospitals, universities, research facilities, commercial nuclear

1 power operations, and other industries within the compact states. The reactor vessel from the Trojan
2 plant, a commercial nuclear power reactor in Oregon, was buried at the site during 2000. Of the total
3 waste receipts at the facility between 1996 and 2001, the state of Oregon accounted for the largest share
4 by volume (65%) and by radioactivity (95%).

6 **1.3.1 DOE National Waste Management**

8 When DOE established the Office of Environmental Management (EM) in 1989, it defined cleanup of
9 DOE sites as a top priority and committed itself to addressing the challenges of waste management. EM
10 is responsible for waste management activities at all DOE sites, including Hanford, and needs to address
11 them on a nationwide basis. This section provides an overview of DOE nationwide plans for manage-
12 ment of radioactive and hazardous waste, including waste from the Hanford Site. The nationwide
13 distribution of sites that dispose of one or more types of DOE radioactive waste are shown in Figure 1.2.
14 The DOE nationwide strategy for managing radioactive, hazardous, and mixed waste is provided by the
15 WM PEIS (DOE 1997c) and associated Records of Decision (RODs) (63 FR 3629, 63 FR 41810, 64 FR
16 46661, 65 FR 10061, 65 FR 82985, 66 FR 38646, 67 FR 56989). Other NEPA documents related to
17 those activities are discussed in Section 1.5.

19 **1.3.1.1 Spent Nuclear Fuel and High-Level Waste**

21 DOE is required by *The Nuclear Waste*
22 *Policy Act of 1982*, as amended (42 USC 10101)
23 to provide disposal capacity for spent nuclear fuel
24 (SNF) generated by commercial nuclear power
25 plants and DOE, as well as high-level waste
26 (HLW) generated by atomic energy defense
27 activities. Spent nuclear fuel is fuel that has been
28 irradiated in a reactor but has not been processed
29 to separate potentially useful materials. High-
30 level waste consists of certain process residues
31 (liquids, solids, or sludges) that result from
32 processing irradiated reactor fuel to recover
33 plutonium and uranium. DOE sites that currently
34 manage HLW and spent nuclear fuel are in the
35 process of stabilizing and storing those materials
36 until a permanent disposal facility is available.
37 DOE is planning to develop a geologic repository
38 at Yucca Mountain in Nevada for disposal of DOE and commercial spent nuclear fuel and HLW from
39 processing of defense materials production reactor fuel (DOE 2002d). The repository is scheduled to
40 open around 2010.

Spent Nuclear Fuel (SNF)

Fuel that has been irradiated in a nuclear power plant or other reactor. Spent fuel is generally thermally hot and highly radioactive.

High-Level Waste (HLW)

High-level waste is the highly radioactive waste material that results from processing of spent nuclear fuel, including liquid waste produced directly in processing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations, and other highly radioactive material that is determined, consistent with existing law, to require isolation.

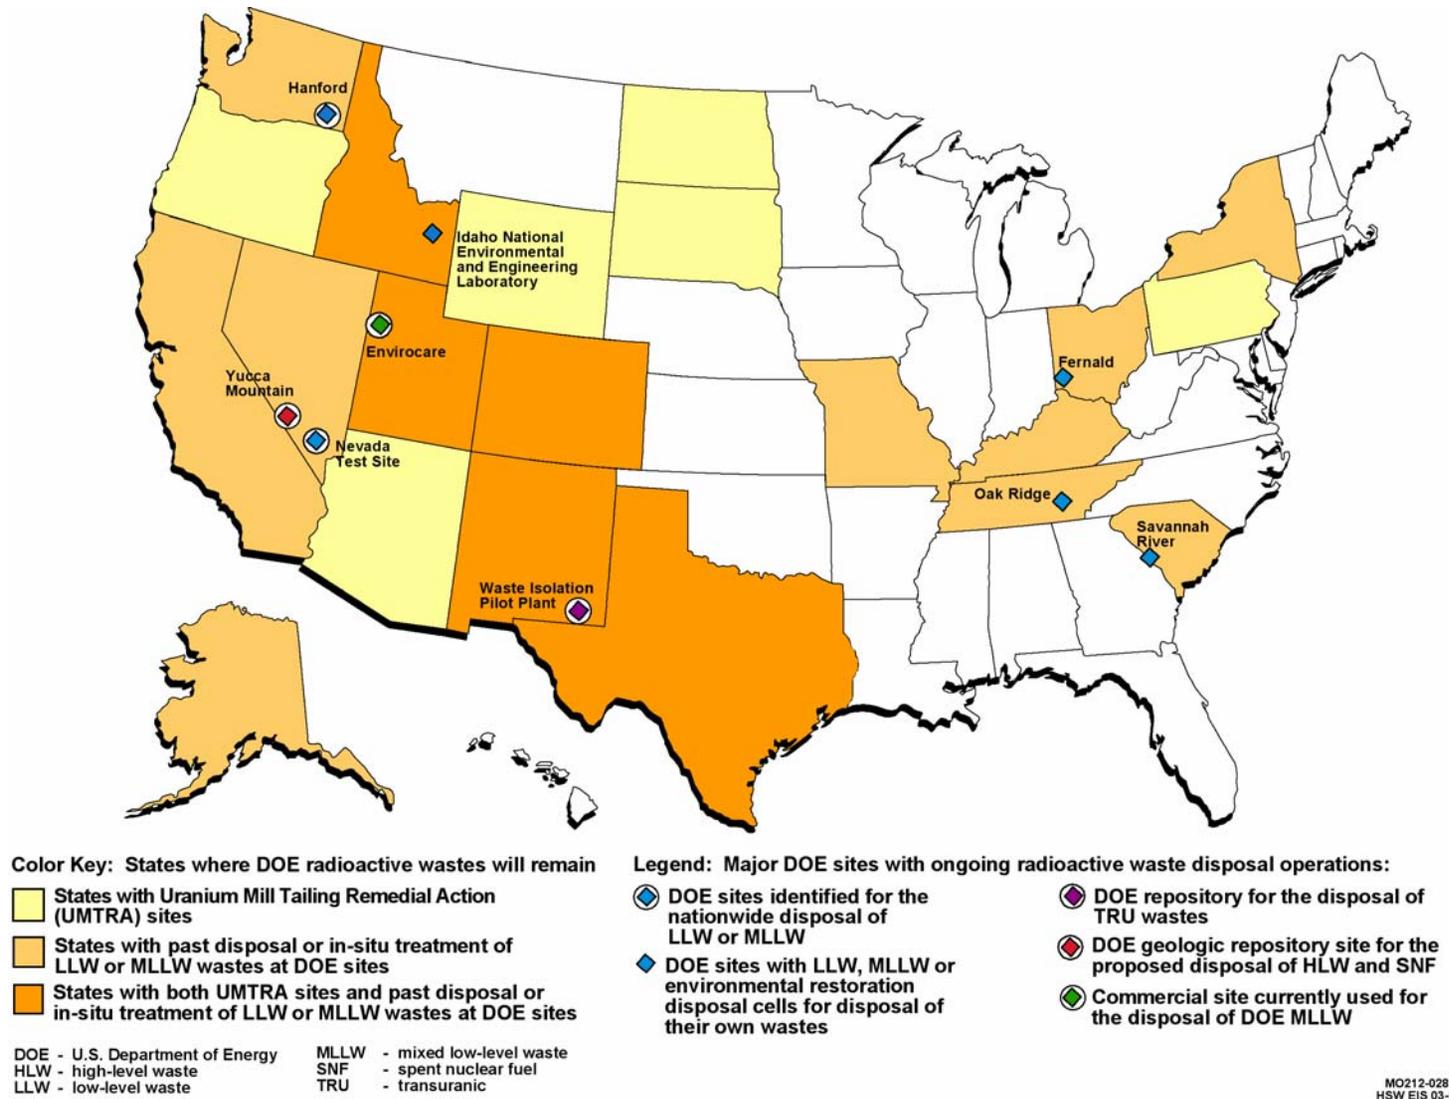

Figure 1.2. States with Radioactive Waste Disposal Activities

1 **1.3.1.2 Transuranic Waste**

2
3 DOE has a repository for disposal
4 of TRU waste in New Mexico at
5 WIPP. WIPP opened in 1999 and
6 received the first shipments of TRU
7 waste from Hanford in 2000. To date,
8 about 80 m³ (2800 ft³) of TRU waste
9 from Hanford have been sent to
10 WIPP. Some TRU waste will also be
11 sent to Hanford for temporary storage
12 from other DOE sites to take
13 advantage of existing and planned
14 capabilities to process and certify
15 TRU waste for disposal at WIPP. All
16 TRU waste sent to Hanford will be
17 shipped to WIPP.

<p style="text-align: center;">Transuranic (TRU) Waste</p> <p>Transuranic waste is radioactive waste containing more than 100 nanocuries (3700 becquerels) of alpha-emitting transuranic isotopes per gram of waste, with half-lives greater than 20 years, except for the following:</p> <ul style="list-style-type: none">• high-level radioactive waste• waste that the Secretary of Energy has determined, with the concurrence of the Administrator of the Environmental Protection Agency, does not need the degree of isolation required by the 40 CFR Part 191 disposal regulations• waste that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61 (DOE 2001g).
--

18
19 Some TRU waste may also contain hazardous components (mixed TRU waste) and would be
20 managed under applicable state and federal hazardous waste regulations. For purposes of evaluation in
21 the HSW EIS, mixed TRU waste has not been identified as a separate waste type from other TRU waste.
22 DOE's hazardous waste permit for WIPP, issued by the State of New Mexico Environment Department,
23 authorizes disposal of some types of mixed TRU waste.

24
25 **1.3.1.3 Low-Level Waste and Mixed Low-Level Waste`**

26
27 DOE plans to continue treating and
28 disposing of LLW and MLLW at facilities that
29 currently have capabilities to manage those
30 wastes (DOE 1997c; 65 FR 10061). Under
31 that ROD, Hanford and the Nevada Test Site
32 (NTS) will continue to receive LLW from
33 other facilities that do not have the capacity to
34 treat or dispose of it. Hanford and NTS were
35 also identified as sites that would treat and
36 dispose of MLLW from other sites. DOE sites
37 also have the option to send waste to
38 commercial disposal facilities, such as
39 Envirocare in Utah. Envirocare received over
40 56,000 m³ (2,000,000) of DOE LLW and
41 MLLW between 1993 and 2000 (Envirocare
42 2000a, b, c). DOE plans to continue shipping some LLW and MLLW to Envirocare. NTS received about
43 65,000 m³ (2,300,000 ft³) of LLW during 2002 and expects to receive an additional 360,000 m³
44 (13,000,000 ft³) through 2006. By comparison, existing forecasts through 2046 indicate that DOE's

<p style="text-align: center;">Low-Level Waste (LLW)</p> <p>Low-level radioactive waste is radioactive waste that is not high-level radioactive waste, spent nuclear fuel, transuranic waste, byproduct material (as defined in Section 11e.(2) of the Atomic Energy Act of 1954, as amended), or naturally occurring radioactive material.</p>
--

<p style="text-align: center;">Mixed Low-Level Waste (MLLW)</p> <p>Mixed low-level waste is LLW that contains both radionuclides subject to the Atomic Energy Act of 1954, as amended (42 USC 2011), and a hazardous component subject to the Resource Conservation and Recovery Act or Washington State Dangerous Waste Regulations.</p>
--

1 Hanford Solid Waste Program could receive up to 220,000 m³ (7,800,000 ft³) of LLW and up to
2 140,000 m³ (4,900,000 ft³) of MLLW from offsite DOE generators. Total LLW and MLLW annual
3 volumes from offsite generators are not expected to exceed 45,000 m³ (1,600,000 ft³).
4

5 The Tank Waste Remediation System
6 (TWRS) EIS summarized formal discussions
7 between DOE and NRC on tank waste
8 classification and how the low-activity
9 portion of the waste might be regulated
10 (DOE and Ecology 1996). Although those
11 consultations were carried out in the context
12 of low-activity waste (LAW) disposal in a
13 grout matrix (Kincaid et al. 1995), the logic
14 was applied to vitrified LAW as well. Based
15 on an NRC published opinion (Bernero 1993;
16 58 FR 12342), the TWRS EIS analysis
17 concluded that the LAW stream could be
18 classified as incidental waste and subjected to
19 disposal requirements for LLW. A second
20 NRC review subsequent to the TWRS EIS
21 indicated that the vitrified waste form
22 selected in the ROD (62 FR 8693) also would provisionally meet criteria for classification as LAW, based
23 on available information provided at that time (NRC 1997).
24

Low-Activity Waste (LAW)

Low-activity waste is the waste that remains after separating from high-level waste as much of the radioactivity as practicable, and that when solidified may be disposed of as low-activity waste in a near-surface facility in accordance with DOE requirements (DOE 2001g).

Immobilized Low-Activity Waste (ILAW)

Immobilized low-activity waste is the solidified low-activity waste from the treatment and immobilization of Hanford tank waste. The ILAW would be disposed of on the Hanford Site or at a qualified offsite facility.

1.3.2 DOE Waste Management Activities at Hanford

25
26

27 Waste generated by past Hanford Site activities contains a variety of radionuclides and non-
28 radioactive hazardous constituents. Those materials range from highly radioactive wastes that must be
29 managed in specialized facilities to less radioactive waste that can be managed by more conventional
30 means, such as shallow land disposal. EM activities at the Hanford Site involve radioactive waste and
31 other radioactive materials. These wastes and materials require different management approaches
32 depending on their specific characteristics, location, and legal and regulatory requirements.
33

34 DOE's waste management policy includes reducing the hazards of waste to people and the
35 environment by minimizing generation of new waste, by treating waste, by placing waste in safer
36 configurations, and by removing waste from environmentally sensitive areas, such as along the Columbia
37 River.
38

39 The Hanford programs for spent nuclear fuel, HLW, environmental restoration, liquid waste and
40 groundwater protection are covered under other NEPA and Comprehensive Environmental Response,
41 Compensation, and Liability Act (CERCLA, 42 USC 9601) reviews. However, they influence the scope
42 of this HSW EIS as generators of waste that would ultimately be managed under the resulting decisions.
43 The relationship of the HSW EIS to the major EM activities at the Hanford Site is outlined here (see
44 Appendix N for additional information):

- 1 • Spent nuclear fuel: Sludge generated during removal of spent fuel and cleanout of the K Basins
2 would be stored at T Plant until a facility is available to process and certify it for shipment to WIPP.
3 In addition, LLW, MLLW, and TRU waste may be generated during activities at the K Basins.
4
- 5 • High-level waste treatment: ILAW and melters from the WTP would be disposed of in near-surface
6 facilities at Hanford. Waste from WTP operations would also require disposal, including equipment
7 removed from HLW tanks during retrieval of HLW and waste generated during operation of the
8 WTP.
9
- 10 • Environmental restoration activities: TRU waste retrieved during CERCLA cleanup of the 618-10
11 and 618-11 burial grounds would be processed and certified for shipment to WIPP, and other
12 operational waste from cleanup activities may require treatment and disposal. The Environmental
13 Restoration and Disposal Facility (ERDF) may also be selected as a potential disposal site for LLW,
14 MLLW, melters, and ILAW. Under DOE policy, NEPA values are integrated into the CERCLA
15 process prior to making remediation decisions (DOE 1994).
16
- 17 • Liquid waste: Leachate from lined disposal trenches would be treated at the Effluent Treatment
18 Facility (ETF), and some solids from ETF would be returned to the Low Level Burial Grounds
19 (LLBGs) for disposal. Other operational waste generated during liquid waste treatment may also be
20 disposed of at Hanford.
21

22 **1.3.2.1 Groundwater Protection**

23
24 Groundwater in the unconfined aquifer beneath the Hanford Site ultimately surfaces at springs near or
25 in the Columbia River, which traverses the northern and eastern parts of the site. Some of the
26 groundwater is contaminated by radionuclides and hazardous chemicals as a result of past liquid disposal
27 practices, leaks, and spills. Past practices that contributed to groundwater contamination have been
28 discontinued, including disposal of untreated liquids to the ground. Programs are underway to stabilize
29 and clean up remaining materials, soil, and groundwater plumes that could present a threat to human
30 health and the environment in the future. Ongoing radioactive and hazardous waste management
31 practices comply with applicable standards, and they are evaluated on a continuing basis to minimize
32 environmental degradation.
33

34 Groundwater monitoring at Hanford is being addressed under milestones established by the TPA
35 independently of this HSW EIS. Groundwater monitoring requirements would apply to whatever actions
36 DOE decides to implement as a result of the analyses conducted under this HSW EIS.
37

38 DOE and a team of contractors have developed, and are implementing, a sitewide program that
39 integrates all assessment and remediation activities that address key groundwater, vadose zone, and
40 related Columbia River issues. This effort is coordinated by the Groundwater Protection Program to
41 support cleanup and closure decisions for the Hanford Site and protection of the Columbia River.
42 Information developed under that program was used to evaluate long-term impacts of LLW and MLLW
43 disposal in this revised draft HSW EIS. Additional information can be found in Appendix N and at
44 <http://www.bhi-erc.com/projects/vadose/>.

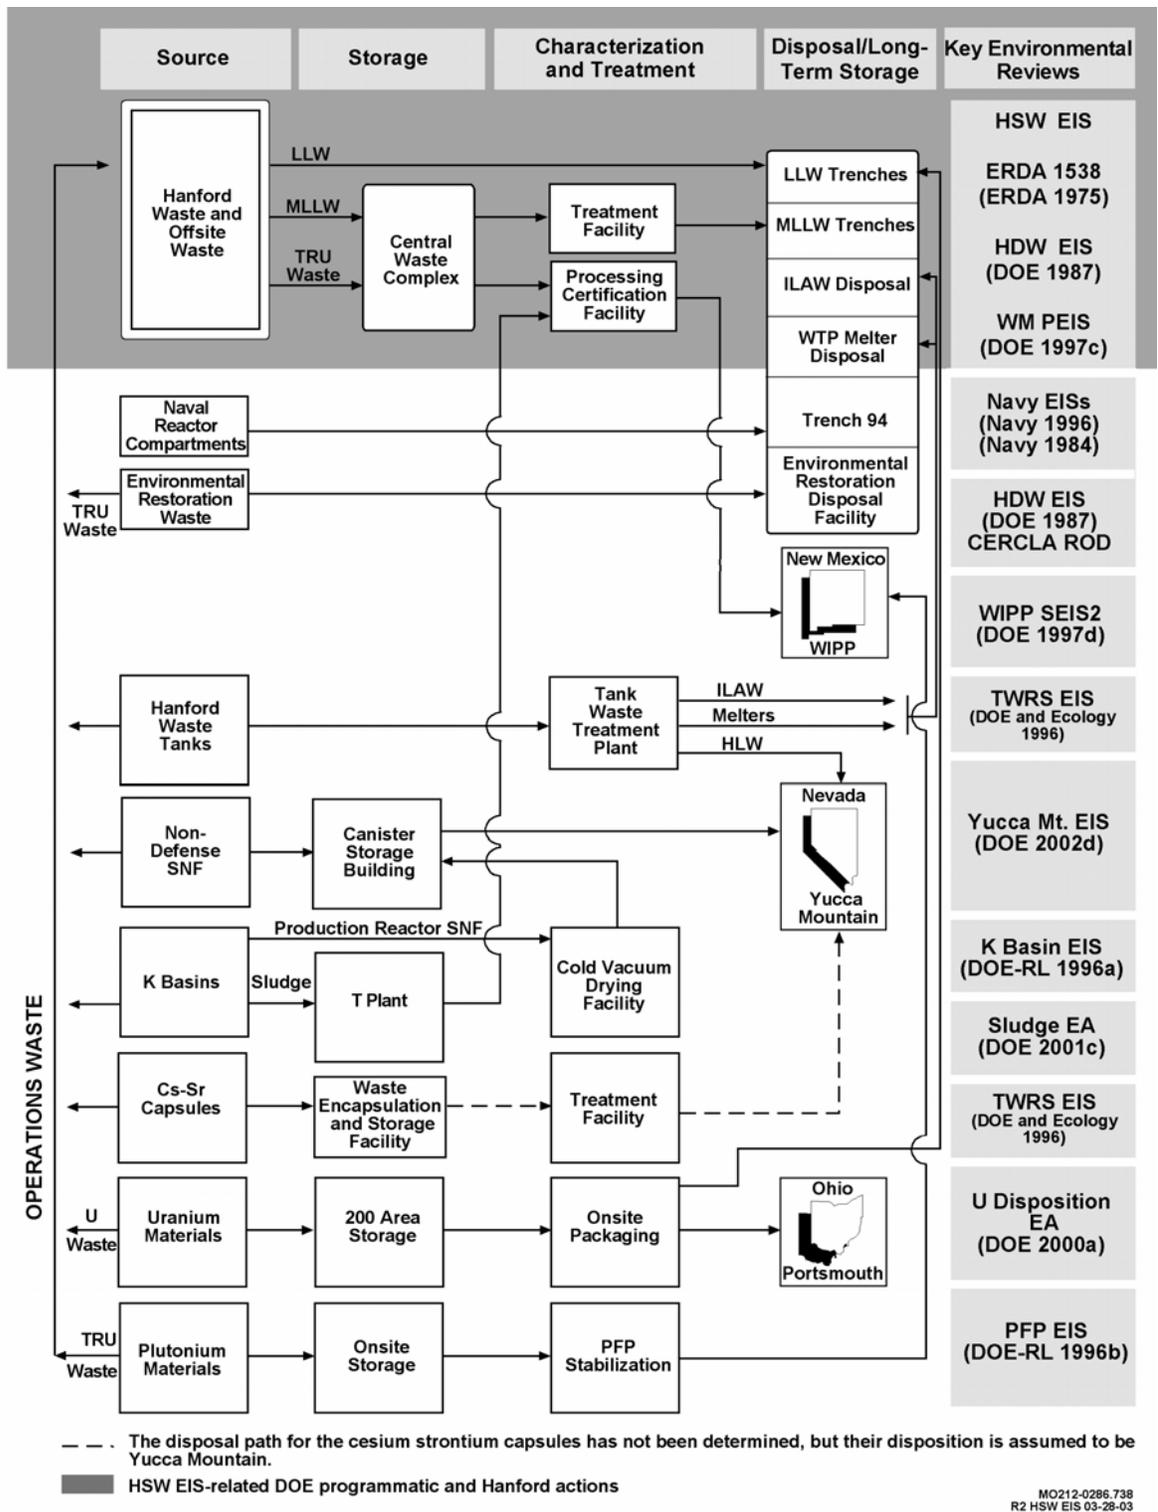

1 **1.3.2.2 The Tri-Party Agreement**
2

3 Beginning in 1986, DOE, the U.S. Environmental Protection Agency (EPA), and the Washington
4 State Department of Ecology (Ecology) began to examine how best to bring the Hanford Site into
5 compliance with RCRA, CERCLA, and applicable State hazardous waste regulations. The regulatory
6 agencies and DOE agreed to develop one compliance agreement establishing milestones for conducting
7 Hanford Site cleanup activities under CERCLA and for bringing operating facilities into compliance with
8 RCRA. Negotiations concluded in late 1988, and the TPA was signed by the three participating agencies
9 on January 15, 1989 (Ecology et al. 1989). The TPA includes a process for revising milestones by mutual
10 agreement of the agencies. Milestones established under the TPA influence some activities proposed in
11 this revised draft HSW EIS. The TPA is discussed further in Section 6.2.
12

13 **1.3.2.3 DOE Decisions Related to Waste Management at Hanford**
14

15 Several decisions have already been made that affect the management of various wastes and other
16 nuclear materials at Hanford. Some of the decisions described in this section are being implemented, and
17 other actions are scheduled to begin at a future time. The relationship between those activities and the
18 alternatives for waste treatment, storage, and disposal as discussed in this HSW EIS is depicted in
19 Figure 1.3. The NEPA and CERCLA reviews that resulted in the decisions illustrated in the figure are
20 also listed. The relationship of the HSW EIS to other documents is further discussed in Section 1.5.
21

- 22 • HLW in Hanford storage tanks will be retrieved and vitrified at an onsite facility. DOE plans to
23 dispose of HLW in a geologic repository at Yucca Mountain in Nevada (DOE 2002d). The TWRS
24 EIS ROD (62 FR 8693) calls for ILAW to be placed in concrete vaults on the Hanford Site.
25
- 26 • Spent nuclear fuel stored in the Hanford K Basins near the Columbia River will continue to be dried
27 and moved to the 200 East Area until it can be sent to the Yucca Mountain repository. A small
28 quantity of other reactor fuel currently stored at Hanford will also be stored in the 200 East Area until
29 it can be disposed of at Yucca Mountain.
30
- 31 • The Hanford Site will manage TRU waste from onsite operations, such as stabilization of plutonium
32 materials at former processing facilities, and from some other DOE sites that do not have capabilities
33 to manage TRU waste. In addition, TRU waste will be retrieved from the 618-10 and 618-11 Burial
34 Grounds near the 400 Area, and retrievably stored TRU waste will be retrieved from the 200 Area
35 LLBGs. TRU waste will be treated as necessary and certified for disposal at WIPP near Carlsbad,
36 New Mexico.
37
- 38 • LLW and MLLW from Hanford and other DOE sites will continue to be stored, treated, and/or
39 disposed of at Hanford.
40
- 41 • Reactor compartments from decommissioned naval vessels will continue to be disposed of in a
42 dedicated facility at Hanford.

1
2
3
4

Figure 1.3. Relationship of the HSW EIS to Other Hanford Cleanup Operations, Material Management Activities, and Key Environmental Reviews

- Contaminated areas along the Columbia River will continue to be cleaned up, especially sites near closed reactors in the 100 Areas and near fuel fabrication facilities in the 300 Area. Closed reactors will be placed into interim safe storage (a process referred to as “cocooning”) to protect people and the environment from the reactor cores until they can be safely removed. Most LLW and MLLW generated during Hanford environmental restoration projects will be sent to a dedicated onsite disposal facility, the Environmental Restoration Disposal Facility (ERDF).

The activities described in this section will result in most of the radioactive materials at Hanford being relocated to offsite facilities for disposal or other disposition. Figure 1.4 shows DOE’s radioactive material disposition plans at Hanford based on their radioactive material content.

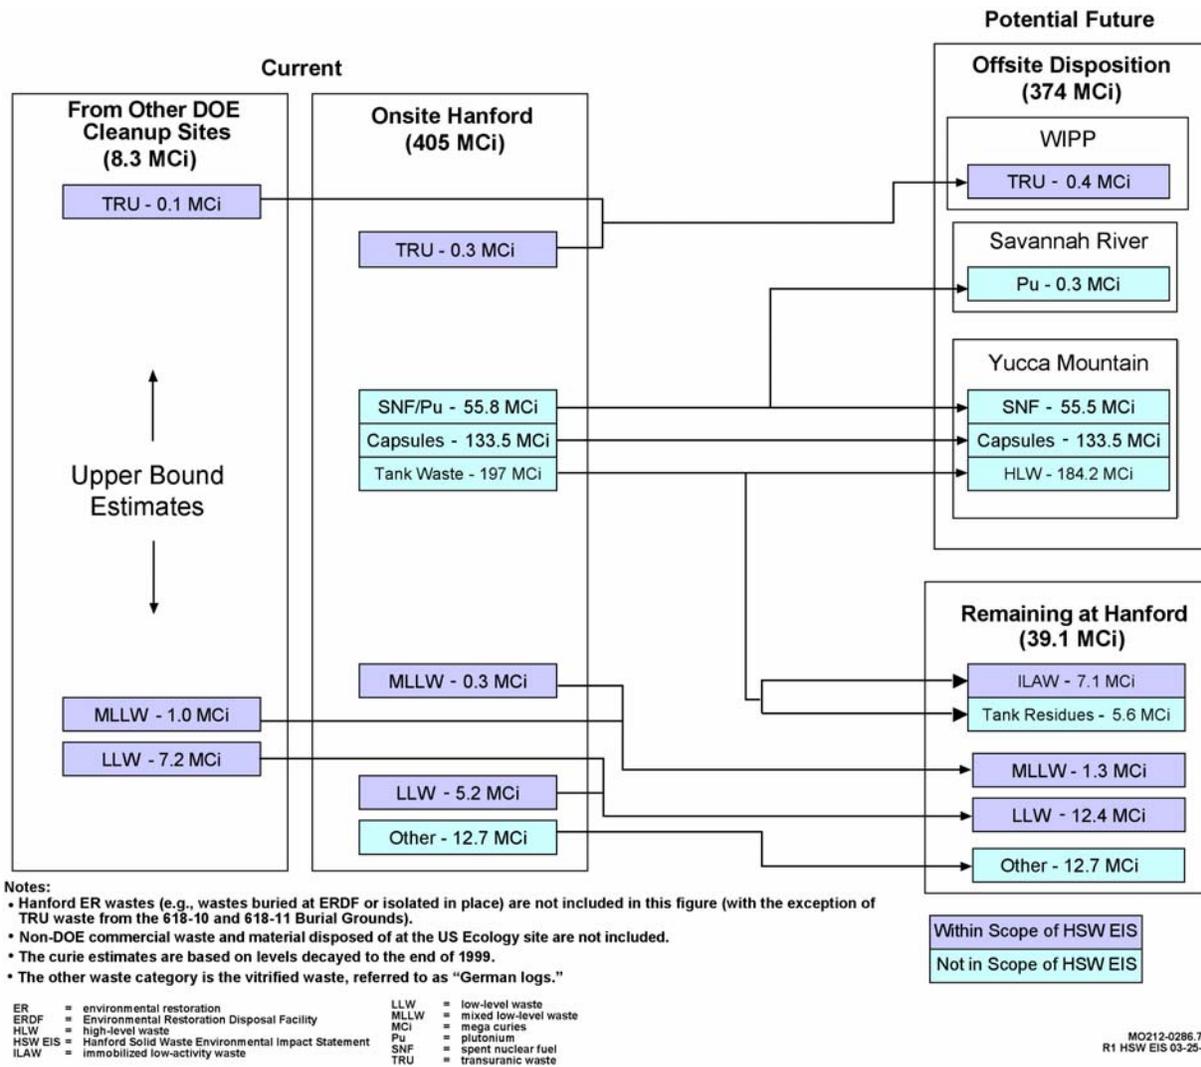

Figure 1.4. Radioactive Material Disposition at Hanford in Terms of Waste Activity (MCi)
