

*Streamflow measured at Malott gage from 1958 to 2002. Comparison of overlapping flow records at the Malott and Tonasket gages demonstrates that flows at Malott are approximately 4% higher than the flows at Tonasket. Based on this relationship, the flow record at Malott can be extended back prior to 1958 by multiplying measured flows at the Tonasket gage (which began operating in 1911, and has continuously recorded flows since 1929) by 1.04.

Figure 3-3. Okanogan River Monthly Streamflow at Malott (1992, 1914-1924, 1930-2002).
